

Document Routing Notes

QUESTION

How should a local document workflow expose each processing step?

The workflow should show the selected input, operation, result, and recovery path.
Files remain local unless the user explicitly starts a translation request.

METHOD

Compare repeatable tasks across three document types

1. Merge two short PDF notes and preserve their page order.
2. Run OCR on an image-only scan and inspect the searchable result.
3. Translate a short English sample with an explicitly selected provider.

OBSERVATION

Visible state reduces uncertainty

A compact route selector keeps the current source and target formats visible.
Logs should state which local framework performed the work and where recovery starts.

Review Checklist

01 INPUT

Synthetic files only

02 PRIVACY

No identifiers or credentials

03 FAILURE

Actionable message and retry path

04 RESULT

New file; source remains unchanged

05 CLEANUP

Local task data removable on demand
